

Tanning in a tanning bed increases your chance of skin cancer by 75%!

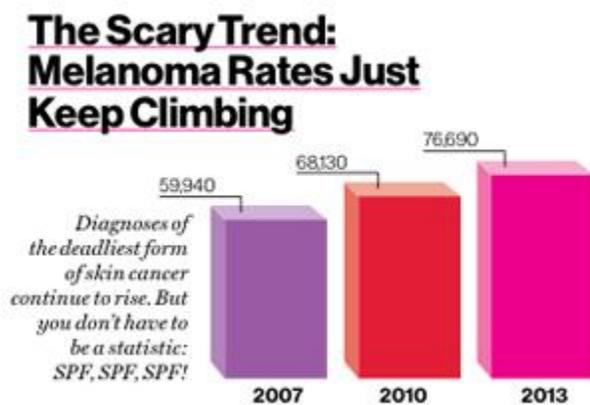

It has been recently placed in the same risk category to your health as arsenic and cigarettes. Every day there is new research about the harmful effects tanning with UVA and UVB have on your health. This issue can no longer be argued or ignored.

Statistics compiled by the Center for Disease Control

Studies have shown consistently that indoor tanning increases a person's risk of getting skin cancer, including melanoma.

A meta-analysis (a research study that looks at data from other studies) by Boniol and colleagues in 2012 combined findings from studies conducted in Europe, Australia, and the United States. The meta-analysis shows a link between indoor tanning and melanoma.

Another meta-analysis published in 2014 by Colantonio and colleagues reconfirmed the association between indoor tanning and melanoma, and also found that newer tanning beds were not safer than older models.

A 2014 study by Wehner and colleagues estimated that more than 400,000 cases of skin cancer may be related to indoor tanning in the United States each year—causing 245,000 basal cell carcinomas, 168,000 squamous cell carcinomas, and 6,000 melanomas.

A 2010 study by Lazovich and colleagues in the United States found that the risk of getting melanoma increased the more years, hours, or sessions spent indoor tanning.

Even the American Academy of Dermatology highlights the risks involved in traditional tanning, telling us that The United States Department of Health and Human Services and the World Health Organization's International Agency of Research on Cancer panel has declared ultraviolet radiation from the sun and artificial sources, such as tanning beds and sun lamps, as a known carcinogen (cancer-causing substance). Indoor tanning equipment, which includes all artificial light sources, including beds, lamps, bulbs, booths, etc., also emits UVA and UVB radiation. The amount of the radiation produced during indoor tanning is similar to the sun, and in some cases might be stronger. Even one indoor tanning session can increase users' risk of developing squamous cell carcinoma by 67

percent and basal cell carcinoma by 29 percent. Indoor tanning before age 24 increases one's risk of developing basal cell carcinoma by age 50.

Variety of Melanoma Skin Lesions

Solution

Airbrush tanning has been endorsed by the American Cancer Society and the American Academy of Dermatology as a “Safe” alternative to the sun UV exposure.

Airbrush Spray Tanning a smarter healthier alternative to tanning in the sun, or in tanning beds. This provides you with the ability to create a better shade of you! Minimize flaws while maximizing tone and definition. By having a tan technician you have the ability to have a controlled level of detail, shading and customizations to achieve a natural looking tan.

If you can't tone it, Spray Tan it."

Everyone feels better with an even skin tone flawless looking tan, and a nice health glow. Endless Glow product enriches your skin with natural vitamins and moisturizers to firm the skin and make it smooth and beautiful. The tanning serum offered is an anti-aging Vitamin A,C,E complex that is firming and helps to slow the signs of aging. The solution is formulated to improve the tone and texture of your skin by using these professional grade ingredients:

Firmaderm: Firming

Anitioxidants: offering repair and protection from the environment.

Caffeine: oxygenates and reduces puffiness in your skin.

Dihydroxyacetone (Eco-Cert DHA)

Aloe Vera in a purified De-Mineralized water

How it's done:

Airbrushing is done standing in a pop up style tent with three sides for privacy. Wearing a black bikini swimsuit is optimal for wearing clothing or undressing to your comfort level, then an airbrush technician will walk you through a series of positions to deliver the most natural looking tan.

The best way to come and be prepared to have a longer lasting tan is to exfoliate and shave, though not essential as Using “Perfect Glow” tanning extender will prolong the life of your tan and smooth out the exfoliation process. Without the tanning extender the tan will naturally fade in around 5-7 days depending on your rate of your body’s exfoliation. Using the complete line for before and after “care products” will deliver the best results.

In the hours immediately after your tanning session. It is best not to sweat or do dishes. Avoid anything that will cause your tan to streak. Don't go out in the rain or let your dog lick you, it will streak you. 😊 lol

Clients should wait at least 8 to 12 hours for the sunless tan to develop do not allow your skin to come in contact with any water base products until your tan has fully developed. This means no make-up or moisturizers lady's! Not before your first shower that has taken place after 8 hours.

While the tanning solution washes out of clothing, unique fabrics could possibly be stained. To be on the safe side wearing dark loose clothing is best during and there shortly after the tanning session is best.

Get your gorgeous natural looking “instant” tan in just 20 min. No more waiting month and hours in the sun to look beautiful. You can have it completely customized exactly how you like it. Host a party of 4 to 5 girls for your free tan today!
